ASSIGNMENT-1

Basic web application using Flask (Python backend) + HTML/CSS frontend.

Introduction

This assignment focuses on building a basic web application using the Python-based web framework Flask along with HTML and CSS for the frontend. Flask is a lightweight and flexible framework that allows developers to quickly create web applications and APIs with minimal setup.

In this project, a simple web server is created using Flask, which handles client requests and sends appropriate responses. The frontend is developed using HTML for structure and CSS for styling, providing a user-friendly interface (such as a login page). The application demonstrates how a backend server communicates with a frontend interface through routing and templates.

Frontend: HTML (login.html)

- Located inside templates/ folder (correct ✔)
- Used to create a **login UI**
- Works with Flask using render_template()

🎨 CSS (style.css)

- Used for styling your login page
- Should be placed in a static/ folder ideally (important ⚠️)

👉 Better structure:

```
static/
  └── style.css
```

🔗 How Everything Connects

Right now:

- Flask → returns plain text
- HTML → not connected yet ❌

✅ What you should do (IMPORTANT PART)

Update your app.py like this:

```
from flask import Flask, render_template

app = Flask(__name__)

@app.route('/')
def home():
    return render_template('login.html')

if __name__ == '__main__':
    app.run(debug=True)
```

👉 Now Flask will:

- Open login.html when you visit /

🔄 Flow of Your Application

1. You run python app.py
2. Flask server starts
3. Browser sends request to /
4. Flask responds with login.html
5. CSS styles the page

Simple Summary

"Create a basic web app using Flask that serves an HTML login page and demonstrates routing."
